

Week 1 Progress Report

Introduction

The first week of my internship focused on understanding my learning abilities, improving my analytical thinking, and strengthening my software engineering fundamentals. Instead of immediately starting development work, my supervisor assessed my current knowledge, identified my strengths and weaknesses, and designed a learning approach that matched my capabilities. This helped me build a strong foundation before moving toward practical software development.

Day 1: Self Mental Assessment

On the first day, my supervisor conducted a **self-mental assessment** consisting of multiple-choice psychological questions. The purpose of this assessment was to evaluate my personality, learning capability, analytical thinking, problem-solving skills, and areas that required improvement.

After reviewing my responses, my supervisor analyzed my overall profile and identified my strengths and weaknesses. Based on these results, a personalized learning plan was prepared for me. This assessment helped me understand where I currently stand, what skills I already possess, and which areas require more attention and guidance. I believe this was one of the most valuable activities because it allowed me to focus on improving my weaknesses from the very beginning of the internship.

Day 2: Fundamental Knowledge Assessment

On the second day, my supervisor evaluated my basic knowledge related to Software Engineering. Various questions were asked regarding software development concepts, requirement analysis, system design, and software development practices. The discussion helped identify the concepts I was already familiar with and those that needed further improvement before starting practical development.

Day 3 to Day 5: Real-Life Requirement Analysis

During the remaining days of the week, we focused on analyzing approximately **20 real-world Software Engineering requirement analysis problems**. Every day, we discussed three to four practical scenarios in detail.

For each problem, we learned how to:

- Identify critical words and important phrases from the problem statement.
- Understand the actual business requirements.
- Analyze the project scope.
- Estimate the possible project cost.
- Understand how architecture affects the system.
- Identify security requirements.
- Analyze system performance requirements.

- Evaluate software quality attributes.
- Discover hidden or missing requirements.
- Gather additional information required from the client.
- Design an appropriate implementation approach for solving the problem.

Each scenario was discussed in depth to understand how a real software system works, how requirements are collected, how different decisions affect the final system, and how an appropriate solution should be implemented.

Skills and Knowledge Gained

During Week 1, I learned:

- Understanding my strengths and weaknesses through self-assessment.
- Improving analytical and critical thinking skills.
- Understanding Software Engineering fundamentals.
- Requirement Analysis techniques.
- Identifying critical words and hidden requirements.
- Scope Analysis.
- Cost Analysis.
- Software Architecture considerations.
- Security Requirement Analysis.
- Performance Requirement Analysis.
- Quality Attribute Analysis.
- Client Requirement Gathering.
- Real-world problem analysis and solution design.

Conclusion

The first week of my internship provided a strong foundation in Software Engineering analysis rather than programming. Through continuous discussions and real-life case studies, I developed a better understanding of how software requirements are analyzed before development begins. The psychological assessment and requirement analysis sessions significantly improved my analytical thinking and prepared me for the practical phases of the internship. This week helped me understand the importance of requirement engineering in developing successful software systems.
